Androgenetic Alopecia-Masumi Inaba 2013-03-14 The authors have perfected a thick-tissue preparation method for observing hair at various stages of growth, and their findings challenge the currently held three-stage common hair cycle. They have put forward a new hypothesis, the four-stage essential hair cycle, that incorporates their discovery that stem cells are located in the isthmal portion of the sebaceous gland. The essential hair cycle is then used to review the factors contributing to the process of androgenetic alopecia, or premature balding, as it is commonly called. This is followed by an explanation of some general measures for the prevention of androgenetic alopecia and a description of the treatments available.

Black Skin-William Montagna 2012-12-02 This book is the first to concentrate on the structure and function of black skin. There are some physiological and structural differences between black and white skin, an area of intense interest is that of differences in response to sunlight and other damaging agents. An understanding of response to damaging agents is central to the problems of preventing or forestalling the early effects of aging in skin (a goal that is responsible for the current expansion in dermatological research). This book provides a concise multi-disciplinary insight into the biology, physiology, and chemistry of black skin. Primary emphasis is on the nature and origin of the pigments and how this is related to specific properties of black skin, such as photoprotection and low incidence of skin cancers, that are lacking in white skin. Other topics covered include dermatology and cosmetics of black skin from a practical viewpoint of skin care and current treatments of pigmentation disorders. Black Skin is accessible to a broad range of readers from graduate students to specialists in physical anthropology, skin biology, dermatology, and cosmetology, as well as medical practitioners. Pseudocarcinoma of the Skin-Boris A. Berenberg 2013-11-27 Among the circumstances that may cause a late or erroneous diagnosis of skin cancer, a most important one is the failure to distinguish a true squamous cell carcinoma of the skin from an atypical, but benign, epidermal hyperplasia which closely mimics the carcinoma clinically and particularly histologically - so-called pseudopetheliothomatous or pseudocarcinomatous hyperplasia. Although there are many publications describing in detail the histologic features of pseudocarcinomatous hyperplasias which arise in various dermatoses or skin tumors, this book appears to be the first attempt to cover the whole subject of pseudocarcinomatous epidermal hyperplasia by considering it not only in its clinical and histopathologic aspects, but also from cytophysiologic and cytogenetic points of view, in relation to squamous cell carcinoma. On the basis of a review of the available literature and of my own comparative clinical, histopathologic, cytophysiologic, and cytogentic investigations in patients and experimental animals, I propose a comprehensive set of criteria of difference and similarity between pseudocarcinoma and true carcinoma of the skin. Hopefully, these criteria will be found useful by physicians in the differential diagnosis between these conditions in cases of doubt and may likewise provide a stimulus to researchers for deliberation. I also hope that this monograph, which is a translation of a revised version of the text originally published in Russian in 1980, will serve our common cause of the fight against cancer. I welcome suggestions regarding the choice and treatment of the material included in the book.

Ophthalmic Histopathology-W. R. Lee 2013-04-17 This book has been written to give guidance to histopathologists who are dealing with pathological specimens submitted to them. It is intended either in a general pathology laboratory or in a specialist ophthalmic pathology laboratory. The bias has been given to the diseases encountered commonly in the routine service or in the autopsy room and the intention is to show how to achieve the maximum information from each specimen. Conventional textbooks deal with diseases of the eye on an anatomical basis, but this is inappropriate for a histopathologist who is studying a globe in which the disease is having various effects on both the individual tissue components. While conventional, it seemed more acceptable to lay the book out under the relatively limited and broad headings which ophthalmologists use as indications for enucleation: "trauma", "tumour", "endophthalmitis", "vascular disease", etc. It also seemed logical to include a separate chapter on ocular disease as it is encountered in the autopsy room and, continuing the theme, to consider a keratoplasty specimen and the topics of orbital biopsy and conjunctival biopsy in separate chapters. In each pathological process, whenever appropriate, it was important to include the effects of modern therapeutic measures because this is one of the main features of interest for the clinician. For the beginner, an introductory chapter on the techniques and rationale of the preliminary systematic macroscopic examination of a globe has been included with an account of the supplementary techniques which are essential for an accurate diagnosis.

Dermatology in Clinical Practice-Zohra Zaidi 2010-03-10 Books on dermatology are either focused for medical s-dents or for students of dermatology. A general practitioner sees a lot of skin patients; about 17% of their patients are related to skin disease. We therefore decided to write a book that should meet the needs of a general practitioner. To make the book helpful for the primary care physician, we have focused more on common skin problems and have discussed the diagnosis and treatment of these disorders in depth to help the general practitioner in diagnosing and treating them. The chapter on the management of skin eases also gives the details of topical, systemic, and the phy- cal modalities used in treating skin disease. Uncommon skin diseases are only mentioned where required. The chapter on cutaneous manifestations of systemic diseases will help the general practitioner to correlate the cutaneous signs of the common medical problems seen by them. Emphasis is laid on the bacterial, fungal, and parasitic disorders that are pre- lent in tropical countries. We have included the common d- eases of other continents, as the general practitioner especially of developed countries has patients from all over the world. Congenital and hereditary disorders are discussed with the corresponding chapters, which makes it easier for the reader to remember. A number of practical points are included with each subject, and history of dermatology is included where appropriate to make the subject interesting to read.

Histology for Pathologists - Stacey E. Mills 2012-07-16 A strong grounding in basic histology is essential for all pathologists. However, there had always been a gap between histology and pathology in which histologic information specifically for the pathologist was often lacking. Histology for Pathologists deals with the microscopic features of normal human tissues, from the perspective of the surgical pathologist. This is the only text that uses human (vs. animal) tissues for the histology. It is the best reference in the literature for information on normal histology, and, as such, is essential for all clinical pathologists. Written by pathologists for pathologists, the new edition updates the pathologist's understanding of normal histology up to date with the incremental advances made in the last five years. The 3rd edition has become a "classic" purchased by virtually all residents beginning their pathology training, as well as pathologists in practice. The 4th edition builds on that substantial foundation. The table of contents remains essentially the same with the exception of some changes in authorship.

Adnexal Tumors of the Skin - Kinya Ishikawa 2012-12-06 Toward a full understanding of the skin adrexa and associated tumors, an accurate and detailed visual record of the various structures encountered is essential. Such a comprehensive survey has, however, hitherto been lacking in works on dermatology; this situation I attempt to remedy in the present atlas by presenting a collection of my own cases over the years. I took almost all the photomicrographs myself using a Nikon Biophot microscope. I would like to express my deep gratitude to Prof. Hitoshi Hatano, Department of Dermatology, School of Medicine, Keio University, who reviewed this book and consented to its publication. I am especially grateful to Dr. Junya Fukuda, Chief Pathologist, Kawasaki Municipal Hospital, who helped in diagnosing routine histological sections of the skin and gave invaluable advice with this book. I am enormously in debt to Mr. Soichi Narutomi, Chief Technician, Section of Pathology, Kawasaki Municipal Hospital, who produced first-class prints from 35-mm films. I must express my deep thanks to the late Mr. Shin Takeichi, Head of Photography, Department of Pathology, School of Medicine, Keio University, who kindly took photomicrographs for me for many years; some of these are included in the present volume. I owe a great deal to Associate Prof. Kan Nizuma, Department of Dermatology, School of Medicine, Tokai University, who kindly arranged for this book to be published by Springer-Verlag. Finally, I should like to acknowledge the efforts and goodwill of Springer-Verlag Tokyo. KINY A ISHIKAWA Spring, 1987 Contents Structure of the Adnexa.
